Compass Ratings (tm) is computing projection using directional linear filtering approach, where we do the following:

1. Collect annual values for the last 9 years
2. Compute mean and standard deviation for the timeseries being projected.
3. Filter out annualized values that are more than 2 sigma away from the mean for this timeseries.
4. If the timeseries's last value is a statistical aberration, then this projection needs to be reviewed manually.
5. Otherwise project by increasing the last value with 10%% of computed sigma in the direcion of the largest trend
